Постановка задачи

Вариант 34.

Реализовать распределенную систему по асинхронной обработке запросов. В данной распределенной системе должно существовать 2 вида узлов: «управляющий» и «вычислительный». Необходимо объединить данные узлы в соответствии с той топологией, которая определена вариантом. Связь между узлами необходимо осуществить при помощи технологии очередей сообщений. Также в данной системе необходимо предусмотреть проверку доступности узлов в соответствии с вариантом. При убийстве («kill -9») любого вычислительного узла система должна пытаться максимально сохранять свою работоспособность, а именно все дочерние узлы убитого узла могут стать недоступными, но родительские узлы должны сохранить свою работоспособность. Управляющий узел отвечает за ввод команд от пользователя и отправку этих команд на вычислительные узлы. Список основных поддерживаемых команд:

• Создание нового вычислительного узла

Формат команды: create id [parent]

id – целочисленный идентификатор нового вычислительного узла parent – целочисленный идентификатор родительского узла. Если топологией не предусмотрено введение данного параметра, то его необходимо игнорировать (если его ввели) Формат вывода:

«Ok: pid», где pid – идентификатор процесса для созданного вычислительного узла

«Error: Already exists» - вычислительный узел с таким идентификатором уже существует

«Error: Parent not found» - нет такого родительского узла с таким идентификатором

«Error: Parent is unavailable» - родительский узел существует, но по каким-то причинам с ним не удается связаться

«Error: [Custom error]» - любая другая обрабатываемая ошибка

Примечания: создание нового управляющего узла осуществляется пользователем программы при помощи запуска исполняемого файла. Id и pid — это разные идентификаторы.

• Исполнение команды на вычислительном узле

Формат команды: exec id [params]

id – целочисленный идентификатор вычислительного узла, на который отправляется команда Формат вывода:

«Ok:id: [result]», где result – результат выполненной команды

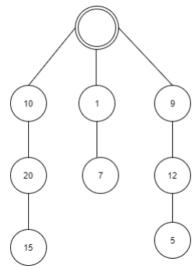

«Error:id: Not found» - вычислительный узел с таким идентификатором не найден

«Error:id: Node is unavailable» - по каким-то причинам не удается связаться с вычислительным узлом

«Error:id: [Custom error]» - любая другая обрабатываемая ошибка

• Топология 2:

Топология 1

Все вычислительные узлы находятся в списке. Есть только один управляющий узел. Чтобы добавить новый вычислительный узел к управляющему, то необходимо выполнить команду: create id -1.

Топология 2

Аналогично топологии 2, но узлы находятся в дереве общего вида.

• Набора команд

Формат команды сохранения значения: exec id subcommand subcommand – одна из трех команд: start, stop, time. start – запустить таймер stop – остановить таймер time – показать время локального таймера в миллисекундах

• Команда проверки

Формат команды: heartbit time Каждый узел начинает сообщать раз в time миллисекунд о том, что он работоспособен. Если от узла нет сигнала в течении 4*time миллисекунд, то должна выводится пользователю строка: «Heartbit: node id is unavailable now», где id – идентификатор недоступного вычислительного узла

Общий метод и алгоритм решения

Операции ZeroMQ:

- void* zmg ctx new(void); создает новый контекст ZeroMQ
- void* zmq socket(void* context, int type); создает сокет ZMQ
- int zmq bind(void* socket, const char* endpoint); привязывает сокет к конечной точке
- int zmq_connect(void* socket, const char* endpoint); подключает сокет к конечной точке
- int zmq_close(void* socket); закрывает сокет ZMQ
- int zmq_ctx_destroy(void* context); завершает контекст ZMQ
- int zmq msg init(zmq msg t* msg); инициализирует пустое сообщение
- int zmq_msg_init_size(zmq_msg_t* msg, size_t size); инициализирует сообщение заданного размера
 - int zmq msg send(zmq msg t* msg, void* socket, int flags); отправляет сообщение
 - int zmq_msg_recv(zmq_msg_t* msg, void* socket, int flags); получает сообщение
 - int zmq_msg_close(zmq_msg_t* msg); освобождает сообщение

Общий алгоритм решения:

- Инициализация управляющего узла (Control Node):
- Создается структура control node t для управления списками вычислительных узлов
- о Инициализируется ZeroMQ контекст для межпроцессного взаимодействия
- Ожидается ввод команд с консоли
- Обработка команд управления:
 - Создание узла (create):
 - Проверка уникальности ID узла
 - Создание структуры compute node t с указанием родительского узла
 - Запуск нового процесса через fork():
 - Дочерний процесс: инициализирует ZeroMQ PULL-сокет и начинает прослушивание команд
 - Родительский процесс: сохраняет PID дочернего процесса, подключается к его сокету через ZeroMQ PUSH
 - Узел добавляется в иерархию:
 - Если parent id == 0 создается новый корневой список
 - Если parent_id > 0 добавляется как дочерний к указанному узлу
 - Выполнение команд (exec [start|stop|time]):
 - Поиск узла по ID
 - Отправка команды через ZeroMQ сокет
 - Узел обрабатывает команду:
 - start: начинает замер времени выполнения
 - stop: останавливает замер и сохраняет результат
 - time: возвращает суммарное время работы
 - ∘ Проверка активности (ping):
 - Проверка существования процесса через waitpid()
 - Отправка тестового сообщения через ZeroMQ
 - Анализ возможности доставки сообщения
- Работа вычислительного узла (Compute Node):
 - Создает PULL-сокет на порту 5550+
 - о В бесконечном цикле:
 - Принимает и парсит команды
 - Управляет таймером выполнения операций
 - Формирует ответы о статусе выполнения
- Особенности взаимодействия:
 - о Используется паттерн PUSH-PULL для однонаправленной коммуникации
 - о Каждый узел работает в отдельном процессе
 - о Поддерживается древовидная структура узлов
 - Реализована обработка статусов процессов (включая проверку зомби-процессов)
- Обработка ошибок:
 - Проверка доступности родительских узлов
 - о Валидация формата команд
 - Обработка сетевых ошибок ZeroMQ
 - о Контроль существования процессов

Strace:

1. Уведомление о новых сообщениях:

- ZeroMQ использует eventfd для уведомления о том, что в очереди появились новые сообщения.
- о Когда сообщение добавляется в очередь, ZeroMQ записывает значение в eventfd.

2. Мониторинг событий:

- ZeroMQ добавляет eventfd и сокеты в epoll.
- Когда epoll_wait возвращает событие, ZeroMQ проверяет, связано ли оно с eventfd или сокетом, и обрабатывает его.
